# ORACLE Academy

## Database Design

9-1
Introduction to Relational Database Concepts

ORACLE Academy

#### **Objectives**

- This lesson covers the following objectives:
  - Define a primary key
  - Define a foreign key
  - -Define a column-integrity rule
  - Identify row, column, primary key, unique key, and foreign key elements given a diagram of a table containing these elements
  - -Identify violations of data-integrity rules

#### Purpose

- The conceptual data model will be transformed into a relational database design
- This means that our entities, attributes, relationships, and unique identifiers will be translated into objects in a relational database
- Compare this to a clothing designer who is taking his design from paper and implementing it with fabric
- The designer needs to understand how to sew the designs just like you will need to understand the structure of relational database objects

#### Relational Database Illustrated

- A relational database is a database that is seen by the user as a collection of two-dimensional tables, each containing rows and columns
- The table below contains employee data

#### **EMPLOYEES** (table name)

	EMPLOYEE_ID	FIRST_NAME	LAST_NAME	DEPARTMENT_ID
Row	100	Steven	King	90
Row	101	Neena	Kochhar	90
	102	Lex	De Haan	90
	200	Jennifer	Whalen	10
	205	Shelley	Higgins	110

#### Language to Access Data

- Structured query language (SQL) allows us to access data in relational databases in an efficient way
- Instead of manually searching through each row to find the record for employee number 200, we use the following SQL statement:

```
SELECT last_name, department_id
FROM employees
WHERE employee_id = 200;
```

 You can see the result of this statement on the next slide

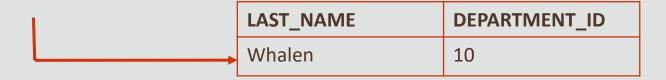

## **SQL** Query Illustrated

#### **EMPLOYEES** (table name)

	EMPLOYEE_ID	FIRST_NAME	LAST_NAME	DEPARTMENT_ID
	100	Steven	King	90
	101	Neena	Kochhar	90
	102	Lex	De Haan	90
•	200	Jennifer	Whalen	10
	205	Shelley	Higgins	110

```
SELECT last_name, department_id
FROM employees
WHERE employee_id = 200;
```

## Specific SQL Query

• To find all the employees in department number 90, we write a different SQL statement:

```
SELECT *
FROM employees
WHERE department_id = 90;
```

Again, you can see the result on the next slide

## Specific SQL Query

	EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
	100	Steven	King	••••	90
$\vdash$	101	Neena	Kochhar	••••	90
$\vdash$	102	Lex	De Haan	••••	90
	200	Jennifer	Whalen		10
1	205	Shelley	Higgins	••••	110

SELECT \*

FROM employees

WHERE department\_id = 90;

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
100	Steven	King	••••	90
101	Neena	Kochhar	••••	90
102	Lex	De Haan	••••	90

## **Primary Key**

 A primary key (PK) is a column or set of columns that uniquely identifies each row in a table

#### **ACCOUNTS**

BANK_NO	ACCT_NO	BALANCE	DATE_OPENED
104	75760	120,050.00	21-OKT-89
104	77956	100.10	
105	89570	55,775.00	15-JAN-85
103	55890	15,001.85	10-MAR-91
105	75760	5.00	22-SEP-03

#### **EMPLOYEES**

#### Multiple Column Primary Key

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
100	Steven	King	••••	90
101	Neena	Kochhar	••••	90
102	Lex	De Haan		90
200	Jennifer	Whalen	••••	10
205	Shelley	Higgins	••••	110

Single Column Primary Key

## **Primary Key**

 Each table should have a primary key, and a primary key must be unique

#### **ACCOUNTS**

BANK_NO	ACCT_NO	BALANCE	DATE_OPENED
104	75760	120,050.00	21-OKT-89
104	77956	100.10	
105	89570	55,775.00	15-JAN-85
103	55890	15,001.85	10-MAR-91
105	75760	5.00	22-SEP-03

#### **EMPLOYEES**

#### Multiple Column Primary Key

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
100	Steven	King	••••	90
101	Neena	Kochhar	••••	90
102	Lex	De Haan		90
200	Jennifer	Whalen	••••	10
205	Shelley	Higgins	••••	110

Single Column Primary Key

## **Primary Key**

 No part of the primary key can be null

#### **ACCOUNTS**

BANK_NO	ACCT_NO	BALANCE	DATE_OPENED
104	75760	120,050.00	21-OKT-89
104	77956	100.10	
105	89570	55,775.00	15-JAN-85
103	55890	15,001.85	10-MAR-91
105	75760	5.00	22-SEP-03

#### **EMPLOYEES**

#### Multiple Column Primary Key

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
100	Steven	King	••••	90
101	Neena	Kochhar	••••	90
102	Lex	De Haan		90
200	Jennifer	Whalen	••••	10
205	Shelley	Higgins	••••	110

Single Column Primary Key

## **Primary Key Candidates**

- A table can have more than one column, or combinations of columns, that could serve as the table's primary key
- Each column, or combination of columns, is called a "candidate" key because it could be selected for use as the primary key

**MEMBER ID** LAST NAME **FIRST NAME PAYROLL ID** 100 **SMITH** DANA 21215 310 **ADAMS TYLER** 59877 210 **CHFN IAWRFNCF** 1101 405 52 **GOMEZ CARLOS** 378 LOUNGANI NEIL 90386

Candidate Key (

## Choose a Candidate Key

- Select one candidate key to be the primary key for the table
- The other candidates become alternate keys (or unique keys)

MEMBER_ID	LAST_NAME	FIRST_NAME	PAYROLL_ID
100	SMITH	DANA	21215
310	ADAMS	TYLER	59877
210	CHEN	LAWRENCE	1101
405	GOMEZ	CARLOS	52
378	LOUNGANI	NEIL	90386

**Primary Key** 

Alternate or Unique Key (UK)

## Foreign Key

• A foreign key
(FK) is a column,
or combination
of columns, in
one table that
contains values
that match the
primary key value
in another table

<b>EMPLOYEE</b>	S
-----------------	---

	EMPLOYEE_ID	FIRST_NAME	LAST_NAME	••••	DEPARTMENT_ID
,	100	Steven	King		90
	101	Neena	Kochhar		90
	102	Lex	De Haan		90
	200	Jennifer	Whalen	••••	10
	205	Shelley	Higgins	••••	110

#### **DEPARTMENTS**

refers to

Foreign Key

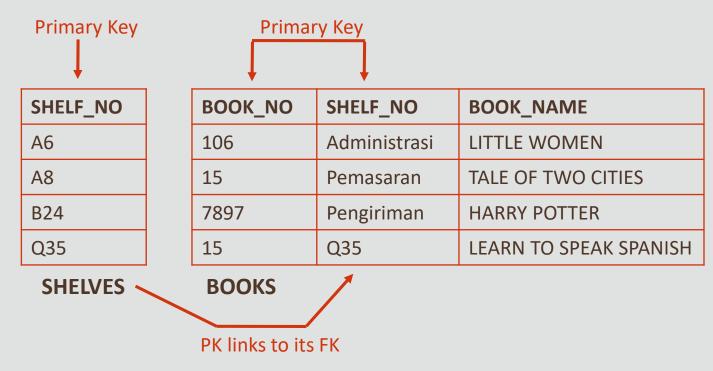

DEPARTMENT_ID	DEPARTMENT_NAME
10	Administrasi
20	Pemasaran
50	Pengiriman
1	

Primary Key

#### Foreign Key Rules

 If a primary key is composed of one or more foreign keys, the FK value cannot be NULL

## Column Integrity

 A column must contain only values that are consistent with the defined data format of the column

#### **ACCOUNTS**

BANK_NO	ACCT_NO	BALANCE	DATE_OPENED
104	75760	120,050.00	21-OKT-89
104	77956	100.10	
105	89570	55,775.00	15-JAN-85
103	55890	15,001.85	10-MAR-91
105	75760	5.00	22-SEP-03

#### **ACCOUNTS Table Definition**

Column Name	Data Type	Optionality
BANK_NO	Number (5)	Not Null
ACCT_NO	Number (8)	Not Null
BALANCE	Number (12,2)	Not Null
DATE_OPENED	Date	

## Summary of Data-Integrity Rules

- Data-integrity rules (also known as constraints) define the relationally correct state for a database
- Data-integrity rules ensure that users can perform only those operations that leave the database in a correct, consistent state

## Summary of Data-Integrity Rules

Constraint Type Explanation		Example	
Entity Integrity	A primary key must be unique, and no part of the primary key can be null	The column emp_no in the EMPLOYEES table cannot be null	
Referential Integrity	A foreign key must match an existing primary key value (or else be null if nulls are allowed)	The value in the dept_no column of the EMPLOYEES table must match a value in the dept_no column in the DEPARTMENTS table	
Column Integrity	A column must contain only values consistent with the defined data format of the column	The value in the balance column of the ACCOUNTS table must be numeric	
User-Defined Integrity	The data stored in a database must comply with the rules of the business	If the value in the balance column of the ACCOUNTS table is below 1.00, we must send a letter to the account owner (this will need additional programming to enforce)	

## Terminology

- Key terms used in this lesson included:
  - -Candidate key
  - -Column
  - -Foreign key
  - -Primary key
  - -Relational database
  - -Row
  - -Unique key

## Summary

- In this lesson, you should have learned how to:
  - Define a primary key
  - Define a foreign key
  - -Define a column-integrity rule
  - Identify row, column, primary key, unique key, and foreign key elements given a diagram of a table containing these elements
  - -Identify violations of data-integrity rules
